Analyzing product sentiment

11 questions

1.

Out of the 11 words in *selected_words*, which one is most used in the reviews in the dataset?

- ○ awesome

- ○ love

- ○ hate

- ○ bad

- ○ great

2.

Out of the 11 words in *selected_words*, which one is least used in the reviews in the dataset?

- ○ wow

- ○ amazing

- ○ terrible

- ○ awful

- ○ love

3.

Out of the 11 words in *selected_words*, which one got the most positive weight in the *selected_words_model*?

(Tip: when printing the list of coefficients, make sure to use print_rows(rows=12) to print ALL coefficients.)

- ⃝ amazing
- ⃝ awesome
- ⃝ love
- ⃝ fantastic
- ⃝ terrible

4.

Out of the 11 words in *selected_words*, which one got the most negative weight in the *selected_words_model*?

(Tip: when printing the list of coefficients, make sure to use print_rows(rows=12) to print ALL coefficients.)

- ⃝ horrible
- ⃝ terrible
- ⃝ awful
- ⃝ hate
- ⃝ love

5.

Which of the following ranges contains the accuracy of the *selected_words_model* on the *test_data*?

○ 0.811 to 0.841

○ <mark>0.841 to 0.871</mark>

○ 0.871 to 0.901

○ 0.901 to 0.931

6.

Which of the following ranges contains the accuracy of the *sentiment_model* in the IPython Notebook from lecture on the *test_data*?

○ 0.811 to 0.841

○ 0.841 to 0.871

○ 0.871 to 0.901

○ <mark>0.901 to 0.931</mark>

7.

Which of the following ranges contains the accuracy of the majority class classifier, which simply predicts the majority class on the *test_data*?

○ <mark>0.811 to 0.843</mark>

○ 0.843 to 0.871

○ 0.871 to 0.901

○ 0.901 to 0.931

8.

How do you compare the different learned models with the baseline approach where we are just predicting the majority class?

- ○ They all performed about the same.

- ○ **The model learned using all words performed *much better* than the one using the only the *selected_words*. And, the model learned using the *selected_words* performed much better than just predicting the majority class.**

- ○ **The model learned using all words performed much better than the other two. The other two approaches performed about the same.**

- ○ Predicting the simply majority class performed much better than the other two models.

9.

Which of the following ranges contains the *'predicted_sentiment'* for the most positive review for *'Baby Trend Diaper Champ'*, according to the *sentiment_model* from the IPython Notebook from lecture?

- ○ Below 0.7

- ○ 0.7 to 0.8

- ○ 0.8 to 0.9

- ○ **0.9 to 1.0**

10.

Consider the most positive review for *'Baby Trend Diaper Champ'* according to the *sentiment_model* from the IPython Notebook from lecture. Which of the

following ranges contains the predicted_sentiment for this review, if we use the *selected_words_model* to analyze it?

○ Below 0.7

○ 0.7 to 0.8

○ 0.8 to 0.9

○ 0.9 to 1.0

11.

Why is the value of the *predicted_sentiment* for the most positive review found using the *sentiment_model* much more positive than the value predicted using the *selected_words_model*?

○ The *sentiment_model* is just too positive about everything.

○ The *selected_words_model* is just too negative about everything.

○ This review was positive, but used too many of the negative words in *selected_words*.

○ None of the *selected_words* appeared in the text of this review.
